

BIG SKY CARE CONNECT

1

Patients Deserve Transparency and the Highest Quality of Care.

The BSCC HIE provides access to comprehensive, real-time health information on your patients in the communities you serve. Timely sharing of vital patient information will promote more informed decision making at the point of care. Informed decision making supports the effective delivery of care and can help avoid readmissions and adverse events, coordinate care planning, improve diagnoses, decrease duplicate testing, and avoid redundant services. The BSCC HIE eliminates healthcare information gaps to improve Montanans' health.

Reduction in the Cost of Health Care.

The HIE will eliminate redundant costs, such as duplicative testing, and reduce time spent on administrative tasks, such as faxing. There's evidence to support significant reduction in readmissions with access to a HIE which results in cost savings. Features like notifications to primary care providers when their patients receive emergency room care can prevent readmissions and supports improved care coordination

3

Providers Deserve Support.

Through the HIE, you can identify and address risk in your community by investing in population health. Access to quality information allows you to take a proactive role in serving your community. BSCC empowers providers with real-time actionable information for more effective interventions at the point of care. Through HIE, providers gain access to medical records in the VA and Department of Defense healthcare systems. Features like alerting and single sign on will improve care transitions and reduce administrative burden through ease of data collection, allowing providers to focus time and energy on what matters most – patients.

Patient Information is Secure.

The HIE is a modern solution for modern healthcare. It allows authorized healthcare providers involved in a patient's care to appropriately access and securely share a patient's vital medical information electronically. The integrity of the patient information exchanged is protected and HIPAA compliant. The data will be secure and confidential, encrypted, and access to patient information will be tracked and audited. The direct secure messaging feature is a secure web-based email service fully encrypted for only authorized users to exchange patient information between individual healthcare providers from healthcare organizations statewide, including Indian Health Services (IHS).

5

Investing in Patients and Providers.

Access to a complete medical patient record saves providers time searching for the information allowing for more time with the patient. The ability to send patient information with referrals to specialists can enhance continuity of care. An HIE can keep providers and the care teams better informed about a patient's condition and status as the patient moves across the continuum of care. This allows for better informed clinical decisions, prevention of potential health concerns, increased patient safety, better health outcomes and higher patient satisfaction.
